The big focus of CS6 was the ability to make layer-based selections (an option that only Photoshop and most advanced photo editors already use). By creating a selections box around a part of your image and moving around it with crosshairs or similar tools, you can more easily select parts of the photo. You can even fill the selection area with a color to signify certain pixels or an object. You can later combine the selection with straight lines (selection to paths), curves, or other selection tools. You see the bottom of the shot below before you know what the bottom of the shot looks like. In many ways, the bottom is much more important than the rest. Maybe it's the one holding up an entire row of plants, or the one that covers part of the window. Regardless of which is which, where things fall on this list is yet another subjective marker that makes it difficult to quantify the importance of each. But this list is worth making for the sake of illustrating the subjectivity. Having remained satisfied with Lightroom 4 as it was, I was surprised to find that Lightroom 5 seems to have very few new features. The only ways that I could find to improve editing is to crop or edit the quality level of the image and to export the image to another format, say that of the camera. Having started with Lightroom from version 1, and developing photography since then, I do not see any need to upgrade. Thankfully Photoshop Photoshop Sketch is coming out soon so I can use a tablet and get more value from product, than I am currently getting.
